

1. Upload files that will be downloaded, for files like images, force image support to download (not open via browser), like this:

For image like this:

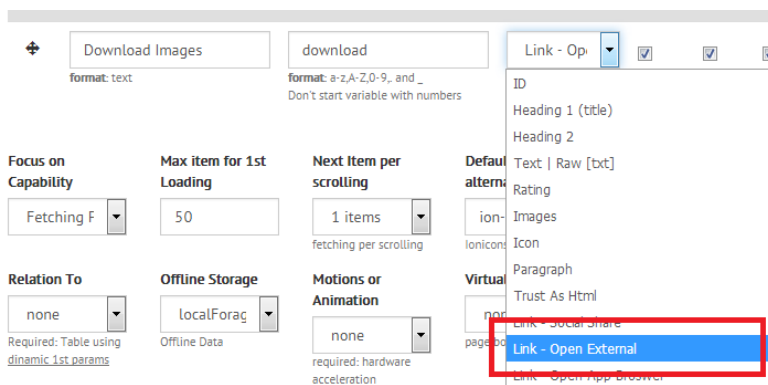

Put this into your .htaccess

```
<FilesMatch "\.(?i:jpg|gif|png)$">
  Header set Content-Disposition attachment
</FilesMatch>
```

Make sure you have **mod_headers** installed and enabled. If error or not work please talk with your hosting provider.

2. To use the **(IMAB) Table** you can use item type Open With External Browser

Using **(IMAB) Page**, you can use link with attributes: **target="_system"** and **run-open-url**, example code like this:

Page Content *

```
1 <a run-open-url href="http://ihsana.net/apk/file-download/test.jpg">Download Image</a>
2
3 <a target="_system" href="http://ihsana.net/apk/file-download/test.jpg">Download Image</a>
```

Or using content rendered on backend, only support using **target="_system"**:
